### Basic

### 1.1 A function

```
// 四捨五入
1 round(double f);
2 ceil(double f);
                          // 無條件捨去
3 floor(double f);
                          //無條件進入
   builtin popcount(int n); // 32bit有多少 1
5 to_string(int s);
                          // int to string
6 /** 全排列要先 sort !!! **/
  next permutation(num.begin(), num.end());
8 prev_permutation(num.begin(), num.end());
9 //用binary search找大於或等於val的最小值的位
10 vector<int>::iterator it = lower_bound(v.
      begin(), v.end(), val);
11 //用binary search找大於val的最小值的位置
  vector<int>::iterator it = upper bound(v.
      begin(), v.end(), val);
13 /*queue*/
  queue<datatype> q;
15 | front(); /*取出最前面的值(沒有移除掉喔!!)*/
16 back(); /*取出最後面的值(沒有移除掉!!)*/
17 | pop(); /*移掉最前面的值*/
18 push(); /*新增值到最後面*/
19 empty(); /*回傳bool,檢查是不是空的queue*/
20 | size(); /*queue 的大小*/
22 /*stack*/
23 stack<datatype> s;
24 | top(); /*取出最上面的值(沒有移除掉喔!!)*/
25 | pop(); /*移掉最上面的值*/
26 push(); /*新增值到最上面*/
27 empty(); /*回傳bool,檢查是不是空的stack*/
28 | size(); /*stack 的大小*/
30 /*unordered set*/
31 unordered_set<datatype> s;
32 unordered set<datatype> s(arr, arr + n);
33 /*initial with array*/
34 insert(): /*插入值*/
35 erase(); /*刪除值*/
36 empty(); /*bool 檢查是不是空*/
37 | count(); /*判斷元素存在回傳1 無則回傳0*/
```

### 1.2 Codeblock setting

```
1 | Settings -> Editor -> Keyboard shortcuts ->
      Plugins -> Source code formatter (AStyle 3 | k在我的理解裡是視題目的要求而定的
2 Settings -> Source Formatter -> Padding
3 Delete empty lines within a function or
      method
4 Insert space padding around operators
5 Insert space padding around parentheses on
      outside
```

6 Remove extra space padding around parentheses

#### 1.3 data range

```
1 int (-2147483648 to 2147483647)
2 unsigned int(0 to 4294967295)
3 long(-2147483648 to 2147483647)
4 unsigned long(0 to 4294967295)
5 long long(-9223372036854775808 to
      9223372036854775807)
6 unsigned long long (0 to
      18446744073709551615)
```

### 1.4 IO fast

```
1 void io()
     ios::sync_with_stdio(false);
      cin.tie(nullptr):
      cout.tie(nullptr);
```

### 1.5 Python

```
1 / * 輸入1*/
2 import sys
3 line = sys.stdin.readline()
4 | /*輸入2*/
5 line = input().strip()
6 D, R, N = map(int, line[:-1].split()) // 分
       三個 int 變數
7 pow(a, b, c) // a ^ b % c
8 print(*objects, sep = ' ', end = '\n')
9 objects -- /*可以一次輸出多個對象*/
10 sep -- /*分開多個objects*/
11 end -- /*默認值是\n*/
```

### DP

### 2.1 3 維 DP 思路

```
1 | 解題思路: dp[i][j][k]
2 i 跟 j 代表 range i ~ j 的 value
 像是 Remove Boxes 當中 k 代表的是在 i 之前還
     有多少個連續的箱子
5 | 所以每次區間消去的值就是(k+1) * (k+1)
6 | 換言之,我認為可以理解成 k 的意義就是題目今
     天所關注的重點,就是老師說的題目所規定的
```

### Knapsack Bounded

```
1 const int N = 100, W = 100000;
2 int cost[N], weight[N], number[N];
3 \mid int c[W + 1];
4 void knapsack(int n, int w)
       for (int i = 0; i < n; ++i)
           int num = min(number[i], w / weight[
           for (int k = 1; num > 0; k *= 2)
               if (k > num)
12
                   k = num;
               num -= k:
14
               for (int j = w; j >= weight[i] *
                     k; --j)
                    c[j] = max(c[j], c[j -
                         weight[i] * k] + cost[i]
16
17
18
       cout << "Max Prince" << c[w];</pre>
```

### Knapsack sample

```
1 int Knapsack(vector<int> weight, vector<int>
        value, int bag Weight)
       // vector<int> weight = {1, 3, 4};
       // vector<int> value = {15, 20, 30};
       // int bagWeight = 4;
       vector<vector<int>> dp(weight.size(),
            vector<int>(bagWeight + 1, 0));
       for (int j = weight[0]; j <= bagWeight;</pre>
           j++)
           dp[0][j] = value[0];
       // weight 數組的大小就是物品個數
       for (int i = 1; i < weight.size(); i++)</pre>
       { // 遍歷物品
           for (int j = 0; j <= bagWeight; j++)</pre>
           { // 遍歷背包容量
13
14
               if (j < weight[i]) dp[i][j] = dp</pre>
                    [i - 1][j];
15
               else dp[i][j] = max(dp[i - 1][j
                    ], dp[i - 1][j - weight[i]]
                    + value[i]);
16
17
       cout << dp[weight.size() - 1][bagWeight]</pre>
             << endl;
```

## 2.4 Knapsack Unbounded

```
_{1} const int N = 100, W = 100000;
  int cost[N], weight[N];
  int c[W + 1];
  void knapsack(int n, int w)
       memset(c, 0, sizeof(c));
       for (int i = 0; i < n; ++i)
           for (int j = weight[i]; j <= w; ++j)</pre>
               c[j] = max(c[j], c[j - weight[i
                    ]] + cost[i]);
       cout << "最高的價值為" << c[w];
11 }
```

int LCIS\_len(vector<int> arr1, vetor<int>

#### 2.5 LCIS

arr2)

```
int n = arr1.size(), m = arr2.size();
       vector<int> table(m, 0);
       for (int j = 0; j < m; j++)
           table[j] = 0;
       for (int i = 0; i < n; i++)
          int current = 0;
           for (int j = 0; j < m; j++)
               if (arr1[i] == arr2[j])
                   if (current + 1 > table[j])
                       table[j] = current + 1;
17
               if (arr1[i] > arr2[j])
                   if (table[j] > current)
                       current = table[j];
20
21
       int result = 0;
       for (int i = 0; i < m; i++)
24
           if (table[i] > result)
               result = table[i];
      return result;
```

### 2.6 LCS

```
int LCS(vector<string> Ans, vector<string>
      int N = Ans.size(), M = num.size();
      vector<vector<int>> LCS(N + 1, vector<</pre>
           int>(M + 1, 0));
      for (int i = 1; i <= N; ++i)
          for (int j = 1; j <= M; ++j)
              if (Ans[i - 1] == num[i - 1])
                  LCS[i][j] = LCS[i - 1][j -
                       1] + 1;
```

```
else
                                                          int maxlen = *max element(LISLen.begin() 28
                                                                                                            cout \langle\langle 1 + 1 \langle\langle ' ' \langle\langle r + 1 \langle\langle ' \rangle n' \rangle\rangle
                                                                                                                                                        32 | // 湊得某個價位的錢幣用量,有哪幾種可能性
                   LCS[i][i] = max(LCS[i - 1][i]

### Mod 性質

則  $a \equiv d \pmod{c}$ 

 $\left\{ \begin{aligned} a &\equiv b (\operatorname{mod} m) \\ c &\equiv d (\operatorname{mod} m) \end{aligned} \right. \Rightarrow \left\{ \begin{aligned} a &\pm c \equiv b \pm d (\operatorname{mod} m) \\ a \cdot c &\equiv b \cdot d (\operatorname{mod} m) \end{aligned} \right.$ 

 $k \in \mathbb{Z}^+, a \equiv b \pmod{m} \Leftrightarrow k \cdot a \equiv k \cdot b \pmod{k \cdot m}$ 

歐拉定理是比較 general 版本的費馬小定理。給定兩個整數 n 和 a ,如果 gcd(a,n)

 $a^{\Phi(n)} \equiv 1 \pmod{n}$  如果 n 是質數  $\Phi(n) = n-1$  也就是費馬小定理。

模逆元是取模下的反元素 · 即為找到  $a^{-1}$  使得  $aa^{-1} \equiv 1 \mod c$ 

整數  $a \in \text{mod } c$  下要有模反元素的充分必要條件為 a, c 互質

模逆元如果存在會有無限個,任意兩相鄰模逆元相差 c

給定一個質數  $p \cdot \mathbb{H} : (p-1)! \equiv -1 \pmod{p}$ 

3 const double PI = atan2(0.0, -1.0);

6.10 Prime table

1 const int maxn = sqrt(INT MAX);

保持基本運算:

• 放大縮小模數

費馬小定理

歐拉定理

6.9

 $a^{p-1} \equiv 1 \pmod{p}$ 

Wilson's theorem
